

CPSC 304 Project Cover Page

Milestone #: ____3____

Date: ____March 6th, 2026_____

Group Number: ____90_____

Name	Student Number	CS Alias (Userid)	Preferred E-mail Address
Kanaad Kalyan Bodkhe	57135345	b1x5s	bodkhekanaad@gmail.com
Saman Atiq	41874207	r0s7p	samanatiq004@gmail.com
Medhansh Choubey	50146505	d4e7x	medhanshchoubey619@gmail.com

By typing our names and student numbers in the above table, we certify that the work in the attached assignment was performed solely by those whose names and student IDs are included above.

In addition, we indicate that we are fully aware of the rules and consequences of plagiarism, as set forth by the Department of Computer Science and the University of British Columbia

2. Project Summary

This project designs a relational database for managing a law firm's daily operations, including lawyers (across three specializations: family, criminal, and corporate) and their clients, legal cases, work logs, hearings, evidence, and billing. Each case is tied to one client and one primary lawyer, with work tracked over time and invoices generated after case completion. The model also represents hearings held at courthouses and manages evidence at the case level with links to hearings when presented.

3. Timeline and Task Breakdown

This timeline reflects our current implementation plan based on the remaining milestone 4, 5 and 6 requirements. We understand that some task ordering may need minor adjustment during development as we gain experience with the stack and the integration process.

Work Distribution: All group members will contribute equally to the project, taking on approximately 33.3% of the total work each. The tasks have been divided into specific database, backend, frontend, and documentation deliverables.

Phase 1: Foundation Setup and Basic CRUD (March 7 – March 18)

- **Medhansh (Database):** Finalize the script with DROP, CREATE, and INSERT statements. Ensure that the database contains enough non-trivial data for later query testing. Write and test the SQL for the Insert and Update queries.
- **Kanaad (Backend):** Set up the Spring Boot environment and establish the Oracle database connection. Build the REST API endpoints for the Insert and Update queries, ensuring proper sanitization and safe handling of user inputs.
- **Saman (Frontend & PM):** Set up the initial GUI structure. Create the user interface forms for the Insert and Update operations, implementing user-facing validation and error handling for invalid inputs, duplicate insertions, and failed operations.

Phase 2: Intermediate Query Development and UI Integration (March 19 – March 26)

- **Medhansh (Database):** Write and test the SQL for the Delete query, ensuring it satisfies the required cascade-on-delete case or the Oracle-appropriate alternative used in our schema. Write and test the SQL for the Join query.
- **Kanaad (Backend):** Write and test the SQL for the Selection and Projection queries. Build and connect the API endpoints for Delete, Join, Selection, and Projection.
- **Saman (Frontend):** Build the Selection interface so users can add multiple conditions and choose AND/OR combinations. Build the Projection interface so users can choose which attributes to display and in what order they are returned. Build the UI components needed to display Join results clearly.

Phase 3: Advanced Query Implementation and Milestone 4 Documentation (March 27 – April 2)

- **Medhansh (Database):** Write and test the SQL for the hardcoded queries: Aggregation with GROUP BY, Aggregation with HAVING, Nested Aggregation with GROUP BY, and Division.
- **Kanaad (Backend & Integration):** Build the API endpoints needed to execute the four advanced queries and connect the results to the frontend.
- **Saman (Documentation):** Draft and format the Milestone 4 PDF. Write the short final project description, document any schema changes from the earlier milestone, prepare the visual representation of the database state, and prepare the full list of SQL queries with their file names and line numbers for grading.

Phase 4: Demo Preparation and Presentation Readiness (April 3 - April 7)

All Members: Use the Milestone 4 submission commit as the fixed demo version and prepare to demonstrate that the code shown at the demo matches the submitted repository state. Practice the Milestone 5 demo flow, re-run the script to ensure tables can be dropped and repopulated smoothly, and prepare for technical questions regarding our respective code sections.

3. AI Usage Declaration

We used ChatGPT to help us with this assignment. A complete PDF of the conversation is attached at the end of this document.

I have attached files for milestone 1, 2 and 3 for our group project. currently i am working on milestone 3 and i want you to assess if the way i have drafted the task timeline is suitable for the instructions that the professor wants in milestone 3 instructions. don't change any wording just tell me if it fulfills the requirements.

3. Timeline and Task Breakdown

This timeline reflects our current implementation plan based on the remaining milestone 4, 5 and 6 requirements. We understand that some task ordering may need minor adjustment during development as we gain experience with the stack and the integration process.

Work Distribution: All group members will contribute equally to the project, taking on approximately 33.3% of the total work each. The tasks have been divided into specific database, backend, frontend, and documentation deliverables.

Phase 1: (March 7 – March 18)

Medhansh (Database): Finalize the script with DROP, CREATE, and INSERT statements. Ensure that the database contains enough non-trivial data for later query testing. Write and test the SQL for the Insert and Update queries.

Kanaad (Backend): Set up the Spring Boot environment and establish the Oracle database connection. Build the REST API endpoints for the Insert and Update queries, ensuring proper sanitization and safe handling of user inputs.

Saman (Frontend & PM): Set up the initial GUI structure. Create the user interface forms for the Insert and Update operations, implementing user-facing validation and error handling for invalid inputs, duplicate insertions, and failed operations.

Phase 2: (March 19 – March 26)

Medhansh (Database): Write and test the SQL for the Delete query, ensuring it satisfies the required cascade-on-delete case or the Oracle-appropriate alternative used in our schema. Write and test the SQL for the Join query.

Kanaad (Backend): Write and test the SQL for the Selection and Projection queries. Build and connect the API endpoints for Delete, Join, Selection, and Projection.

Saman (Frontend): Build the Selection interface so users can add multiple conditions and choose AND/OR combinations. Build the Projection interface so users can choose which attributes to display and in what order they are returned. Build the UI components needed to display Join results clearly.

Phase 3: (March 27 – April 2)

Medhansh (Database): Write and test the SQL for the hardcoded queries: Aggregation with GROUP BY, Aggregation with HAVING, Nested Aggregation with GROUP BY, and Division.

Kanaad (Backend & Integration): Build the API endpoints needed to execute the four advanced queries and connect the results to the frontend.

Saman (Documentation): Draft and format the Milestone 4 PDF. Write the short final project description, document any schema changes from the earlier milestone, prepare the visual representation of the database state, and prepare the full list of SQL queries with their file names and line numbers for grading.

Thought for 4 seconds >

Mostly yes. Your drafted timeline does satisfy the main Milestone 3 requirement for a detailed timeline and task breakdown, because it goes beyond vague labels and specifies concrete remaining work in the database, backend, frontend, API, query, and documentation layers. That matches the professor's requirement that the breakdown show meaningful planning and explicitly identify things such as GUI work and backend API endpoints.  milestone_3

What clearly works:

- The tasks are assigned to specific people, which the instructions explicitly require.  milestone_3
- You explicitly state equal contribution at 33.3% each, which is consistent with the requirement to state the work percentage if relevant.  milestone_3
- The timeline is detailed enough to show you understand what remains, especially the GUI requirement, frontend forms, validation, API endpoints, query implementation, and integration. That is exactly the level of specificity they say they want instead of just saying front end, back end, database.  milestone_3

One issue:

- Your text says the timeline is based on the remaining milestone 4, 5 and 6 requirements. In the milestone 3 instructions shown here, they ask for what is left to do and refer generally to the milestone 4-5-6 description document, so that framing is not wrong. But your actual phases only go up to April 2 and mostly cover Milestone 4 style implementation and documentation prep. If your professor or TA expects the timeline to visibly account for all remaining milestones through demo and final submission, then this may look slightly incomplete in scope, even though the task detail itself is strong. The instructions say they want to see that the group understands the scope of what is left to do and is prepared to accomplish the remaining tasks in a reasonable manner.  milestone_3

So the accurate assessment is:

- Yes, it fulfills the core requirement for a detailed, realistic, specifically assigned task breakdown.
- The only possible weakness is that it may not fully show the full remaining project scope for milestones 5 and 6 if those later deliverables are not reflected somewhere else in your submission.

Sources

milestone 5 and 6 is just project demo, there isn't significant work that needs to be done. its just preparation for the presentation based on the work we have already done.

Thought for 7s >

Then that concern mostly goes away.

Based on the Milestone 3 instructions, your timeline is still suitable even if Milestones 5 and 6 are mainly demo and presentation stages, because the requirement is to show that your group has meaningfully considered what is left to do and assigned concrete remaining implementation work. The instructions focus on detailed remaining development tasks, especially GUI, backend flow, and API/query integration, not on padding the timeline with low-effort demo prep.  milestone_3

Your draft does that correctly:

- it breaks work into specific phases with dates,
- it assigns every task to a named member,
- it includes concrete frontend, backend, database, and documentation work,
- it explicitly accounts for GUI and API endpoints, which the professor directly says they want to see.  milestone_3

Also, the instructions say equal work is assumed unless otherwise stated, and your 33.3% statement is fully consistent with that.  milestone_3

So the answer is yes, your drafted timeline fulfills the requirement. The fact that Milestones 5 and 6 are mostly demo-oriented does not create a problem, because the milestone 3 document is really checking whether your group understands and has planned the substantive implementation work that remains.  milestone_3

I want you to give me suitable header names for each of the phases that i have highlited in my task distribution so that it is easy to understand what is getting done in each phase by just looking at the header. keep it concise and accurate

Thought for a second

Phase 1: Foundation Setup and Basic CRUD

Phase 2: Intermediate Query Development and UI Integration

Phase 3: Advanced Query Implementation and Milestone 4 Documentation

give me a header for phase 4 where i just state that the team members will be working on preparing for the demo presentation after april 2nd for the demo on april 7th

Phase 4: Demo Preparation and Presentation Readiness
